This test is well written. I also like how you moved the hash password function into a separate script, and then imported it into the main index.js. This is a good example of remediating Structural Complexity.

Testing the AI is a good idea. I think that if there was a way to make sure that the response the AI gives is correct for more complex queries, it would make the testing more complete. Perhaps have another AI check it's answer?

good idea with the styling i wasnt too worried about, but it was a good change but the method seems a bit overloaded

This is a good visual change. I think that if these values can instead be pulled from the web server back-end, it would allow these values to be dynamic, which would be useful if someone were to develop this project further.

Good functionality in making the trimmed email an actual variable, instead of just doing email.trim. Always good seperating js from the html files. Logout function looks good

I like that you automatically open the car info dropdown, so the user can quickly see info about their car. However, maybe with proper usability testing with real human testers we could determine if this is what users actually want or if they want all the dropdowns to be closed, or if they want something else to happen. Great work overall.

Place your javascript for signup.html and login.html in a separate js file.

Having the car page show not just live data, but also the static car specifications, would definitely be useful for users. But with this current implementation it would not be possible for users to own two of the same car make and model. I think that each car should be identified with a unique ID, so if a user has multiple of the same car make/models, they can add them to our app.
